## ALIGNMENTS

```
APPLICANT: Dade Behring Marburg GmbH
ITILE OF INVENTION: Carbohydrate deficient transferrin (CD'
ITILE OF INVENTION: antibodies, their preparation and use
FILE REFERENCE: 2002/B001
[CURRENT APPLICATION NUMBER: US/10/612,162
[CURRENT FILING DATE: 2003-07-03
[PRIOR APPLICATION NUMBER: 10230550.1
[PRIOR FILING DATE: 2002-07-05
[PRIOR FILING DATE: 2002-07-05
[PRIOR FILING DATE: 2003-05-19
[PRIOR FILING D
APPLICANT: PRIOR, Christopher P.
APPLICANT: LAI, Char-Huei
APPLICANT: LAI, Char-Huei
APPLICANT: TURNER, Andrew
TITLE OF INVENTION: MODIFIED TRANSFERRIN FUSION PROTEINS

This invention describes a novel antibody that, in aqueous solution, binds selectively to carbohydrate-deficient transferrin (CDT) without having to bind CDT to a solid phase. The invention also describes an antibody that binds selectively to CDT at regions containing the sequences VVARSWGKEDLIWELL, TYEDSIAKINNGRADAMSLDGGF, SKLSNGSGLNLSEDN and YEKYLGEBYWKAV (ADG46075-ADG46078) and an immunoassay for detecting CDT using the antibodies of the invention. The antibodies of the invention are monoclonal, specifically from hybridomas DSM ACC2540 or 2541. The antibodies are obtained by immunisation with non-glycosylated transferrin, or a fragment, then generation of hybridomas by standard fusion of spleen and myeloma cells. Hybridomas are then selected for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antibody specific for carbohydrate-deficient transferrin, useful for diagnosis of alcoholism, can bind its target in solution, eliminating

                                                                                   The present invention describes an assay for a protein having at least two isoforms with different glycosylation patterns. The assay involves contacting a sample containing the protein with a proteolytic enzyme, followed by detecting the content or relative content of at least one peptide fragment produced by proteolysis. Also described is a kit for the assay method comprising the proteolytic enzyme and a substrate bound specific binding partner (S1) for at least 2 of the isoforms of the proteins. The method can be used for assaying isoforms of proteins according to their glycosylation pattern to determine their concentration or relative concentration in the sample or material (e.g. blood). The method avoids use of antibodies for distinguishing between glycosylated isoforms of the proteins. The present sequence represents a transferrin apptide fragment which is used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              production of antibodies that specifically bind CDT from the aqueous phase. The antibodies are useful for diagnosis of alcoholism, CDT, which lacks glycosylation at Asn413 and/or Asn 611, is present only in alcoholics. The antibodies allow direct detection of CDT in solution, eliminating the need for immobilising it on a solid phase (as required when using known antibodies). ADG46075-ADG46094 represent CDT peptide fragments used in the method of the invention.

                                                                                                                                                       The present invention describes an assay for a protein having at least two isoforms with different glycosylation patterns. The assay involves contacting a sample containing the protein with a proteolytic enzyme, followed by detecting the content or relative content of at least one peptide fragment produced by proteolysis. Also described is a kit for the assay method comprising the proteolytic enzyme and a substrate bound specific binding partner (S1) for at least 2 of the isoforms of the proteins. The method can be used for assaying isoforms of proteins according to their glycosylation pattern to determine their concentration or relative concentration in the sample or material (e.g. blood). The method avoids use of antibodies for distinguishing between glycosylated isoforms of the proteins. The present sequence represents a transferrin peptide fragment which is used in the exemplification of the present
                                                                                                               Sequence 15 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel isolated marker for rheumatoid arthritis selected from one of many (around 400) markers defined in the specification. Rheumatoid arthritis is a chronic inflammatory disorder of the small joints which is estimated to affect 2.1 million people in the united States alone. Current approaches to treat the disease include the use of non-steroidal antiinflammatory drugs (NSAIDS), which may reduce pain, swelling and inflammation, and disease-modifying anti-rheumatic drugs (DMARDS), which act to slow the progression of the disease and avoid further joint injury. These drugs are associated with a number of serious side effects and the search for improved therapeutics is a subject of activity and may be useful in preparing a composition for diagnosing or treating rheumatoid arthritis. The current sequence is that of a human rheumatoid arthritis marker peptide of the invention.
                                                                                                                                                                                                                                                                                           Human rheumatoid arthritis marker peptide - SEQ ID 180.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 1; SEQ ID NO 184; 184pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel isolated marker for rheumatoid arthritis selected from one of many (around 400) markers defined in the specification. Rheumatoid arthritis is a chronic inflammatory disorder of the small joints which is estimated to affect 2.1 million people in the use of non-steroidal antiinflammatory drugs (NSAIDS), which may reduce pain, swelling and inflammation, and disease-modifying anti-rheumatic drugs (DMARDS), which act to slow the progression of the disease and avoid further joint injury. These drugs are associated with a number of serious side effects and the search for improved therapeutics is a subject of active research. The marker of the invention demonstrates antiarthritic activity and may be useful in preparing a composition for diagnosing or treating rheumatoid arthritis. The current sequence is that of a human rheumatoid arthritis marker peptide of the invention.

The transferrin binding molecule of the invention is useful for preventing and treating bacterial infections (e.g. bacterial meningitis and otitis media). The present amino acid sequence represents a peptide that is bound by transferrin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises a molecule (e.g. peptide) which is capable of: binding to a region of a transferrin protein that is recognized by a bacterial transferrin binding protein; and eliciting an antibody to the bacterial transferrin binding protein. The transferrin binding molecule of the invention is useful for preventing and treating bacterial infections (e.g. bacterial meningitis and outlis media). The present amino acid sequence represents a region of the human transferrin protein that is recognized by a bacterial transferrin binding protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             31-JAN-2003; 2003US-0444113P

                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                      The invention relates to a novel method for analyzing a mixture of proteins. The method involves selecting sets of peptides from several peptides, sequencing one or more portions of the peptides in two or more sets of peptides, to produce a data set, and determining the likelihood of the presence of two or more proteins in the mixture of proteins based on two or more data sets. The invention further comprises an article of manufacture comprising a computer-readable media with computer-readable instructions for carrying out the method. The method is useful for analyzing a mixture of proteins. The method is useful for carrying out the method is useful for soreening and characterization of protein mixtures. This sequence represents a human serum albumin (HSA) peptide fragment used in the novel protein analysis

Peptides were synthesised having amino acid sequences in order from N-terminal sequence of prothrombin kringle-2 by overlapping 2-5 amino acids of both N-terminal and C-terminal of peptides. These peptides were purified by high performance liquid chromatography (HPLC). Kringle domains from prothrombin have anti-endothelial cell proliferation and anti-tumour activities. These inhibit angiogenesis which is involved in tumour growth. They are also useful for the treatment of cancer, e.g. skin, laryngeal, uterine, colon, lung and bone marrow cancer. The human prothrombin kringle-2 significantly suppresses tumour growth in vivo
                                                                                                                                                                      ADV23201 standard; peptide; 15

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antibody production against allergenic antigen (Ag) is specifically suppressed by treatment with the junctional segment of the alpha and/or beta chain of the Ag receptor of suppressor T (Ts) cells (TCR) induced by tolerogenic Ag-PBG conjugates. Induction of antigen-specific suppression by treatment of mice with TCR alpha-chain peptides was demonstrated using the peptides given in AAR62912-17. The peptides of AAR62914 corresponds to the J-alpha region of the CDR3 segment of the alpha chain of ovalbumin-specific Ts cells. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            complementarity determining region; immunosuppressive; antibody engineering; suppressor T-lymphocyte; Ts; ovamonoclonal antibody; myeloma; IgG.

Eleven antigens were prepared from the library and used to immunise mice, after 10 days the mice received injections of pristane to induce arthritis and the animals examined for incidence of arthritis. A preferred anti-arthritic peptide was found to correspond to residues 21-31 of full length hsp65 (see AAR94772). Peptides conty. this sequence are used in the diagnosis, treatment and prophylaxis (may be used in a vaccine) of autoimmune diseases such as rheumatoid arthritis

This fragment has been allocated as a group 10 peptide which is composed of the fragments found in AAW43541 to AAW43550. Mycobacterial hsp65 is known to be an immunodominant antigen in a number of infectious diseases and is linked to pristane induced arthritis (PIA) in vitro, however heat shock proteins and peptides derived from microbial sources may act as self antigens and thus have limited clinical use. The human hsp65 homologue, hsp58, or fragments of the hsp58 protein (see AAW14948-W14950) may be useful in the development of vaccines for prophylaxis or treatment of an autoimmune disease such as rheumatoid arthritis. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                       80

Microbiol. 153:89-98(2002).

-I- FUNCTION: Conjugation of reduced glutathione to a wide number of exogenous and endogenous hydrophobic electrophiles.
-I- CATALYTIC ACTIVITY: RX + glutathione = HX + R-S-glutathione.
-I- SUBUNIT: Monomer and homodimer.
-I- SUBUNIT: Monomer and homodimer.
-I- SUBUNIT: Monomer and homodimer.
-I- SUBUNIT: Monomer to the GST superfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Copyrighted by the UniProt Consortium, see http://www.uniprot.org/terms Distributed under the Creative Commons Attribution-NoDerivs License
